Acute Bronchitis vs. Pneumonia

Almost all cases of acute bronchitis are viral, and 70% of outpatient visits for cough are for acute bronchitis.

Unlike pneumonia, acute bronchitis lacks shortness of breath, hypoxia and abnormal pulmonary examination

	Acute cough Management Flowchart			
	Acute Bronchitis	Pneumonia		
Symptoms & Clinical Findings	- cough (productive or nonproductive) <3 weeks - pulmonary examination may be normal or demonstrate wheezes - often with nasal congestion/rhinorrhea - low-grade fevers may be present - myalgias and headache may be present	 cough (productive or nonproductive), fevers, chills, shortness of breath abnormal pulmonary findings (crackles and/or decreased breath sounds, dullness, tachypnea) myalgias and headache may be present Post-influenza bacterial pneumonia develops about a week after onset of influenza illness COVID and influenza should be ruled out before starting antibiotics, unless local rates of these viruses are low Chest radiography confirms diagnosis of pneumonia Do not order blood/sputum cultures (or urine antigen tests) for outpatients with suspected pneumonia CRB-65 can help assess severity of illness & disposition in patients with pneumonia (consider transfer to ED if score ≥ 2) Age >65 (1 point) SBP <90 mmHg, or DBP ≤60 mmHg (1 point) Confusion (1 point) 		
	1. Evaluation should focus on ruling out pneumonia (which is rare among healthy adults) 2. Chest radiography is not indicated if suspicion for pneumonia is low 3. Pediatric patients – Chest radiography may be warranted in atypical disease (absence of viral symptoms, severe distress, frequent recurrences or lack of improvement			
Antibiotic Treatment	Antibiotics not recommended, regardless of cough duration See Adjunctive Measures	See chart below for antibiotic guidance for pneumonia See Adjunctive Measures		
Adjunctive measures	- Home remedies (lemon, honey, etc.) - Expectorants e.g., guaifenesin - Oral hydration & humidified/steamed air	- Cough suppressants e.g., benzonatate - Acetaminophen or NSAIDs for fever & discomfort		

	Adults & Adolescents Bacterial Pneumonia Treatment		Pediatric Bacterial Pneumonia Treatment
Antibiotics for Pneumonia	Without comorbidities* Amoxicillin 1 g TID for 5 days OR Doxycycline 100 mg BID for 5 days (also the Low, Moderate and High Risk Beta-lactam Allergy History option) With comorbidities* Standard Antibiotics (select ONE from Box C & ONE from Box D):		Up to 6 months Infants under 6 months of age with suspected bacterial pneumonia should be hospitalized ≥6 months (select ONE) Amoxicillin 90 mg/kg/day divided BID to TID for 5 days (dose based on amox component) (maximum dose (amox): 4 g/day) Amoxicillin-clavulanate 90 mg/kg/day divided BID-TID for
	Box C 1, Amoxicillin-clavulanate 875 mg/125 mg BID for 5 days 2. Cefpodoxime†^ 200 mg BID for 5 days (also Low &	Box D 1. Azithromycin 500 mg QD for 1 day, then 250 mg QD for 4 days 2. Doxycycline 100 mg BID for 5 days	5 days Use ES suspension 600 mg-42.9 mg/5 mL (dose based on amox component) (maximum dose (amox): 4 g/day) Penicillin Allergy History (see NM O/P Allergy Risk Assessment first):
	OR For High Risk Beta Lactam Allergy History (see NM O/P Allergy Risk Assessment first): Levofloxacin 750 mg QD for 5 days (select ONE)		Low or Moderate Risk Allergy History (select ONE) Cefpodoxime^ 10 mg/kg/day divided BID for 5 days (maximum dose: 400 mg/day) Cefixime^ 8 mg/kg/day divided BID for 5 days (maximum dose: 400 mg/day) High Risk Beta Lactam Allergy History 6 months to 5 years
	*Comorbidities: heart, lung, liver or kidney disease; alcohol use disorder; diabetes mellitus or malignancy †For patients on acid suppressive therapy, use cefpodoxime 400 mg BID Adissimilar drug structure from penicillins		Levofloxacin 16 to 20 mg/kg/day divided BID for 5 days (maximum dose: 750 mg/day) ≥5 years Levofloxacin 8 to 10 mg/kg/day once daily for 5 days (maximum dose: 750 mg/day)

Key Points for Counseling Patients

- 1. Most cases of bronchitis are viral; antibiotics are not recommended
- 2. Viral bronchitis can last 3 weeks
- 3. Colored or cloudy sputum is seen in both viral and bacterial infections
- 4. Avoid side effects by avoiding unnecessary antibiotics

When to Consider Transfer to ED

- 1. CRB-65 score ≥2
- 2. Age <6 months
- Updated 10 18 2023
- 3. Severe immunocompromise, asplenia or active receipt of chemotherapy
