

COVID-19 Guidance

This is intended to guide appropriate treatment for COVID-19 in the inpatient setting. Antivirals must be ordered through the order set.

Severity	Treatments
Hospitalized for COVID-19 and Requires New Conventional Oxygen	Remdesivir x 5 days (200 mg x 1, then 100mg daily x 4 days) AND Dexamethasone: 6mg IV or PO once daily for 10 days or until hospital discharge (whichever is first)
Hospitalized for COVID-19 and Requires High Flow Nasal Cannula, Non-Invasive Ventilation, New Mechanical Ventilation or ECMO	Dexamethasone: 6mg IV or PO once daily for 10 days or until hospital discharge (whichever is first) AND PO baricitinib: 4 mg once daily (adjust for renal dysfunction) up to 14 days or until hospital discharge (whichever is first) OR IV tocilizumab: 8 mg/kg x1 (actual body weight, max dose = 800mg) If patient is immunocompromised or has evidence of ongoing viral replication: ADD Remdesivir x 5 days (200 mg x 1, then 100mg daily x 4 days)
